About the Farm

In Indonesia lies a hidden jewel, the island of Bali. The eruption of the Gunung Agung Volcano in 1963 caused a delay in the progress of modern-day coffee cultivation on Bali. In response to this situation, the government enacted programs to help rejuvenate coffee production. With the distribution of coffee seedlings to local farmers, an island wide coffee growing campaign began. Today, the coffee growing area in Bali is an estimated 7,500 hectares. Coffee tree varieties include Bourbon and Typica, along with shade trees such as Erythrina, Albizia, Tangerine and Orange. The use of pesticides is prohibited, and all fertilizers are 100% organic. The Subak Abian is a traditional farming structure organization in Bali, similar to a farmer cooperative. There are 13 different Subak Abians that are currently growing and processing coffee. The promotion of improved coffee growing practices is expected to enhance not only agricultural technology but social and economic standing in Bali as well.
